

Project: Agentic AI Loan Origination and Credit Assessment Platform

Project No: P000481SE

As At: 12/08/2026

No	Description	Impact	L'hood	Owner	Mitigation Strategies	Contingency Plan
1	The AI may give an incorrect loan assessment or recommendation, which could affect the accuracy of the application decision.	H	M	AI/ML Lead	Test the AI with different loan scenarios and use predefined financial rules and calculations. AI results will also be reviewed by a human when confidence is low.	Send the application to a loan officer for manual assessment and prevent the AI from making the final decision.
2	The AI may provide incorrect information to customers during the loan application conversation.	H	M	AI/ML Lead	Use controlled prompts and approved loan-product information. Regularly test AI responses to make sure they are accurate and relevant.	Stop or limit the affected AI function and allow the customer to continue with a loan officer.
3	The AI may incorrectly read or extract information from documents such as payslips or bank statements.	H	M	Document/Data Lead	Test document processing with different document formats and include validation checks for important information.	Ask the customer to upload the document again or allow a loan officer to manually check and correct the extracted information.
4	Customer personal and financial information could be accessed by someone who is not authorised.	H	M	Security Lead	Use secure authentication, role-based access, encryption, and secure document storage. Access to sensitive information will be limited to authorised users.	Restrict access to the affected system or account, investigate the issue, and fix the security problem before restoring access.
5	Integration with the bank's existing systems may be more difficult than expected because different banks may use different APIs.	H	M	Integration Lead	Define API requirements early and use mock APIs during development so that the team can continue working without depending on the real banking system.	Use a simulated banking system for the prototype and document the required integration for future development.
6	Requirements may change during the project, which could increase the team's	M	H	Project Manager	Regularly review the product backlog and discuss requirement changes with the project	Focus on the Must-Have requirements and move lower-priority features to a later stage.

	workload and affect the delivery schedule.				supervisor and sponsor before adding new work.	
7	The project may be delayed because Agentic AI development and system integration can be more complex than initially expected.	H	M	Project Manager	Break large features into smaller PBIs, monitor sprint progress, and discuss blockers during daily stand-up meetings.	Reduce the scope to the core MVP and postpone non-essential features.
8	The AI may produce inconsistent or biased recommendations for different customer situations.	H	M	AI/ML Lead	Test the AI using a wide range of customer scenarios and apply consistent financial assessment rules. Human review will also be available for uncertain cases.	Require manual review for affected applications and temporarily disable automated recommendations if a serious issue is identified.
9	Some team members may not have enough experience with Agentic AI, document processing, or financial assessment.	M	M	Project Manager	Share knowledge within the team, research unfamiliar technologies early, and assign tasks based on team members' skills.	Simplify the implementation and use established tools or APIs where possible.
10	AI model or API usage limits may affect development and testing, particularly if the system requires many AI requests.	M	M	Technical Lead	Monitor API usage, set usage limits, and use mock responses during early development and testing.	Use an alternative AI model or API, or use mock AI responses for non-critical features.
11	Not having enough realistic test data may make it difficult to properly test the financial assessment and document-processing features.	M	M	QA Lead	Create different test scenarios covering various incomes, expenses, liabilities, loan amounts, and document types.	Create additional synthetic test data and manually validate important test cases.
12	Incorrect financial formulas or lending rules could result in an inaccurate loan assessment.	H	M	Financial/Business Lead	Clearly define the formulas and lending rules and test them using known example scenarios before using them in the assessment process.	Stop the affected assessment function and require manual calculation or review until the issue is fixed.
13	Customers or loan officers may not trust the AI recommendation if the system does not clearly explain how the decision was reached.	M	M	Product Owner	Show the evidence, financial calculations, reasons, and confidence level behind each AI recommendation.	Allow a loan officer to review and explain the recommendation or override the AI decision when required.

14	A weakness in authentication or user permissions could allow someone to access features or information they should not have access to.	H	L	Security Lead	Use role-based permissions, secure authentication, API security, and regular security testing.	Disable the affected account or feature, fix the security issue, and retest the system before enabling it again.
----	--	---	---	---------------	--	--

Impact = Impact on the Business or project in the event the risk is realized

L'hoo = Likelihood of risk being realized
